

# Chapter 12 Lecture – The Cost of Capital

## Chapter 12 Lecture – The Cost of Capital

### Learning Objectives

After studying this chapter, you should be able to:

**LO1** Determine a firm's cost of equity capital.

**LO2** Determine a firm's cost of debt.

**LO3** Determine a firm's overall cost of capital.

**LO4** Identify some of the pitfalls associated with a firm's overall cost of capital and what to do about them.

12-2

### What Types of Long-term Capital do Firms Use?

12-3

### Cost of Capital Basics

- The cost to a firm for capital funding = the return to the providers of those funds
  - The return earned on assets depends on the risk of those assets
  - A firm's cost of capital indicates how the market views the risk of the firm's assets
  - A firm must earn at least the required return to compensate investors for the financing they have provided
  - The required return is the same as the appropriate discount rate

12-4

# Chapter 12 Lecture – The Cost of Capital

## Cost of Equity

- The cost of equity is the return required by equity investors given the risk of the cash flows from the firm
- Two major methods for determining the cost of equity
  - Dividend growth model
  - SML or CAPM

12-3

## The Dividend Growth Model Approach

Start with the dividend growth model formula and rearrange to solve for  $R_E$

$$P_0 = \frac{D_1}{R_E - g}$$

$$R_E = \frac{D_1}{P_0} + g$$

12-4

## Example: Dividend Growth Model

- Your company is expected to pay a dividend of \$4.40 per share next year. ( $D_1$ )
- Dividends have grown at a steady rate of 5.1% per year and the market expects that to continue. ( $g$ )
- The current stock price is \$50. ( $P_0$ )
- What is the cost of equity?

$$R_E = \frac{4.40}{50} + .051 = .139$$

12-7

## Example: Estimating the Dividend Growth Rate

- One method for estimating the growth rate is to use the historical average

Year	Dividend	Percent Change
2009	1.23	
2010	1.30	$(1.30 - 1.23) / 1.23 = 5.7\%$
2011	1.36	$(1.36 - 1.30) / 1.30 = 4.6\%$
2012	1.43	$(1.43 - 1.36) / 1.36 = 5.1\%$
2013	1.50	$(1.50 - 1.43) / 1.43 = 4.9\%$

$$\text{Average} = (5.7 + 4.6 + 5.1 + 4.9) / 4 = 5.1\%$$

12-8

# Chapter 12 Lecture – The Cost of Capital

## Advantages and Disadvantages of Dividend Growth Model

- **Advantage** – easy to understand and use
- **Disadvantages**
  - Only applicable to companies currently paying dividends
  - Not applicable if dividends aren't growing at a reasonably constant rate
  - Extremely sensitive to the estimated growth rate
  - Does not explicitly consider risk

12-9

## The SML Approach

Use the following information to compute the cost of equity

- Risk-free rate,  $R_f$
- Market risk premium,  $E(R_M) - R_f$
- Systematic risk of asset,  $\beta$

$$R_E = R_f + \beta_E (E(R_M) - R_f)$$

12-10

## Example: SML

- Company's equity beta = 1.2
- Current risk-free rate = 7%
- Expected market risk premium = 6%
- What is the cost of equity capital?

$$R_E = 7 + 1.2(6) = 14.2\%$$

12-11

## Advantages and Disadvantages of SML

- **Advantages**
  - Explicitly adjusts for systematic risk
  - Applicable to all companies, as long as beta is available
- **Disadvantages**
  - Must estimate the *expected* market risk premium, which does vary over time
  - Must estimate beta, which also varies over time
  - Relies on the past to predict the future, which is not always reliable

12-12

# Chapter 12 Lecture – The Cost of Capital

## Weighted Average Cost of Capital (WACC)

- Use the individual costs of capital to compute a weighted “average” cost of capital for the firm
- This “average” = the required return on the firm’s assets, based on the market’s perception of the risk of those assets
- The weights are determined by how much of each type of financing is used

12-13

## WACC

$$\text{WACC} = (E/V) \times R_E + (P/V) \times R_P + (D/V) \times R_D \times (1 - T_C)$$

Where:

Weights  $\begin{cases} (E/V) = \% \text{ of common equity in capital structure} \\ (P/V) = \% \text{ of preferred stock in capital structure} \\ (D/V) = \% \text{ of debt in capital structure} \end{cases}$

Component costs  $\begin{cases} R_E = \text{firm's cost of equity} \\ R_P = \text{firm's cost of preferred stock} \\ R_D = \text{firm's cost of debt} \end{cases}$

$T_C$  = firm’s corporate tax rate

12-14

## Estimating Weights

### Given:

- Stock price = \$50
- 3m shares common stock
- \$25m preferred stock
- \$75m debt
- 40% Tax rate

### Component Values:

- $V_E = \$50 \times (3 \text{ m}) = \$150\text{m}$
- $V_P = \$25\text{m}$
- $V_D = \$75\text{m}$
- $V_F =$
- $\$150 + \$25 + \$75 = \$250\text{m}$

### Weights:

$$\begin{aligned} E/V &= \$150/\$250 = 0.6 \text{ (60\%)} \\ P/V &= \$25/\$250 = 0.1 \text{ (10\%)} \\ D/V &= \$75/\$250 = 0.3 \text{ (30\%)} \end{aligned}$$

12-15

## WACC

Component	W	R
Debt (before tax)	0.30	10%
Preferred Stock	0.10	9%
Common equity	0.60	14%

$$\text{WACC} = E/V \times R_E + P/V \times R_P + D/V \times R_D (1 - T_C)$$

$$\begin{aligned} \text{WACC} &= 0.6(14\%) + 0.1(9\%) + 0.3(10\%)(1-.40) \\ \text{WACC} &= 8.4\% + 0.9\% + 1.8\% = 11.1\% \end{aligned}$$

12-16

# Chapter 12 Lecture – The Cost of Capital

## I. The cost of equity, $R_E$

A. Dividend growth model approach (from Chapter 7):

$$R_E = D_t/P_0 + g$$

where  $D_t$  is the expected dividend in one period,  $g$  is the dividend growth rate, and  $P_0$  is the current stock price.

B. SML approach (from Chapter 11):

$$R_E = R_f + \beta_E \times (R_M - R_f)$$

where  $R_f$  is the risk-free rate,  $R_M$  is the expected return on the overall market, and  $\beta_E$  is the systematic risk of the equity.

## II. The cost of debt, $R_D$

A. For a firm with publicly held debt, the cost of debt can be measured as the yield to maturity on the outstanding debt. The coupon rate is irrelevant. Yield to maturity is covered in Chapter 6.

B. If the firm has no publicly traded debt, then the cost of debt can be measured as the yield to maturity on similarly rated bonds (bond ratings are discussed in Chapter 6).

## III. The weighted average cost of capital, WACC

A. The firm's WACC is the overall required return on the firm as a whole. It is the appropriate discount rate to use for cash flows similar in risk to the overall firm.

B. The WACC is calculated as:

$$WACC = (E/V) \times R_E + (D/V) \times R_D \times (1 - T_c)$$

where  $T_c$  is the corporate tax rate,  $E$  is the market value of the firm's equity,  $D$  is the market value of the firm's debt, and  $V = E + D$ . Note that  $E/V$  is the percentage of the firm's financing (in market value terms) that is equity, and  $D/V$  is the percentage that is debt.

12-17

## Factors that Influence a Company's WACC

- **Market conditions, especially interest rates, tax rates and the market risk premium**
- **The firm's capital structure and dividend policy**
- **The firm's investment policy**
  - **Firms with riskier projects generally have a higher WACC**

12-18

## Eastman Chemical – 1 Equity Data

Eastman Chemical Company Common (EMN) - NYSE

**53.74 +0.40(0.73%)** 3:11PM EST - Nasdaq Real Time Price

## Eastman Chemical - 5 Cost of Equity - SML

- **Beta:** Yahoo Finance 2.31  
Value Line 1.25  
(1.25 is a more reasonable value)
- **T-Bill rate = 0.05%** (Yahoo Finance bonds section)
- **Market Risk Premium = 7%** (assumed)
- **Cost of Equity (SML) = 0.05% + (1.25)(7%) = 8.80%**

$$R_E = R_f + \beta_E (E(R_M) - R_f)$$

12-23

## Eastman Chemical - 6 Cost of Equity - DCF

- **Growth rate 7.67%**
- **Last dividend \$1.04**
- **Stock price \$53.74**

$$\text{Cost of Equity (DCF)} = R_E = \frac{D_1}{P_0} + g$$

$$R_E = \frac{\$1.04(1.0767)}{53.74} + .0767$$

$$R_E = 9.75\%$$

12-24

# Chapter 12 Lecture – The Cost of Capital

## Eastman Chemical - 7 Cost of Equity

Cost of Equity Method	Estimated Value
SML	8.80%
DCF	9.75%
Average	9.28%

12-25

## Eastman Chemical - 8 Bond Data

Coupon Rate	Maturity	Book Value (face value, in millions)	Price (% of par)	Yield to Maturity
3.00%	2015	\$250	103.513%	2.028%
6.30	2018	176	117.634	3.342
5.50	2019	250	114.180	3.390
4.50	2021	250	106.992	3.570
7.25	2024	243	121.530	4.843
7.625	2024	54	122.308	5.151
7.60	2027	222	126.478	5.051

Source: <http://www.sec.gov>

12-26

## How to Find Cost of Debt

- **Method 1: Ask an investment banker what the coupon rate would be on new debt.**
- **Method 2: Find the bond rating for the company and use the yield on other bonds with a similar rating.**
- **Method 3: Find the yield on the company's debt, if it has any.**

12-27

## Eastman Chemical - 9 Cost of Debt

Coupon Rate	Book Value (face value, in millions)	Percentage of Total	Market Value (in millions)	Percentage of Total	Yield to Maturity	Book Values	Market Values
3.00%	\$ 250	0.17	\$ 258.78	0.16	2.03%	0.35%	0.32%
6.30	176	0.12	207.04	0.12	3.34	0.41	0.42
5.50	250	0.17	285.45	0.17	3.39	0.59	0.58
4.50	250	0.17	267.48	0.16	3.57	0.62	0.57
7.25	243	0.17	295.32	0.18	4.84	0.81	0.86
7.63	54	0.04	66.05	0.04	5.15	0.19	0.20
7.60	222	0.15	280.78	0.17	5.05	0.78	0.85
	<u>\$1,445</u>	<u>1.00</u>	<u>\$1,660.89</u>	<u>1.00</u>		<u>3.74%</u>	<u>3.81%</u>

For Eastman, the cost of debt is similar when using either book values or market values.

12-28

# Chapter 12 Lecture – The Cost of Capital

## Eastman Chemical - 10 WACC

Capital structure weights (market values):

$E = 136.92 \text{ million} \times \$53.74 = \$7.358 \text{ billion}$

$D = 1.661 \text{ billion}$

$V = \$7.358 + 1.661 = 9.019 \text{ billion}$

$E/V = 7.358 / 9.019 = .82$

$D/V = 1.661 / 9.019 = .18$

Tax rate (assumed) = 35%

Cost of Equity Method	Estimated Value
SML	8.80%
DCF	9.75%
Average	9.28%

$$WACC = (E/V) \times R_E + (D/V) \times R_D \times (1 - T_C)$$

$$WACC = .82(9.28\%) + .18(3.81\%)(1-.35) = 8.02\%$$

12-29

<http://thatswacc.com>

## Risk-Adjusted WACC

- A firm's WACC reflects the risk of an average project undertaken by the firm
  - “Average”  $\rightarrow$  risk = the firm's current operations
- Different divisions/projects may have different risks
  - The division's or project's WACC should be adjusted to reflect the appropriate risk and capital structure

12-30

## Using WACC for All Projects

- What would happen if we use the WACC for all projects regardless of risk?
- Assume the WACC = 15%

Project	IRR	Project Beta	WACC=15%
A	14%	0.60	Reject
B	16%	1.20	Accept

12-31

## Using WACC for All Projects

- Assume the WACC = 15%
- A project's required return is calculated using the SML and the project's Beta
- Adjusting for risk changes the decisions
- Assume  $R_f = 7\%$      $RR = R_f + \text{Beta} (WACC - R_f)$ 
  - Project A     $7\% + 0.6 (15\% - 7\%) = 11.8\%$
  - Project B     $7\% + 1.2 (15\% - 7\%) = 16.6\%$

Project	IRR	Required Return	Decision	
			WACC=15%	Risk Adj
A	14%	11.8%	Reject	Accept
B	16%	16.6%	Accept	Reject

12-32

# Chapter 12 Lecture – The Cost of Capital

## Divisional Risk & the Cost of Capital

FIGURE 12.1

The security market line, SML, and the weighted average cost of capital, WACC

If a firm uses its WACC to make accept-reject decisions for all types of projects, it will have a tendency toward incorrectly accepting risky projects and incorrectly rejecting less risky projects.

12-33

## Pure Play Approach

- Find one or more companies that specialize in the product or service being considered
- Compute the beta for each company
- Take an average
- Use that beta along with the CAPM to find the appropriate return for a project of that risk
- Pure play companies can be difficult to find

12-34

## Subjective Approach

Consider the project's risk relative to the firm overall risk

- If the project is riskier than the firm, use a discount rate greater than the WACC
- If the project is less risky than the firm, use a discount rate less than the WACC

Risk Level	Discount Rate	
Very Low Risk	WACC – 8%	6%
Low Risk	WACC – 4%	10%
Same Risk as Firm	WACC	14%
High Risk	WACC + 6%	20%
Very High Risk	WACC + 10%	24%

12-35

## What Factors Influence a Company's WACC?

- Market conditions, especially interest rates and tax rates.
- The firm's capital structure and dividend policy.
- The firm's investment policy. Firms with riskier projects generally have a higher WACC.

Is the firm's WACC correct for each division?

- NO! The composite WACC reflects the risk of an average project undertaken by the firm.
- Different divisions may have different risks. The division's WACC should be adjusted to reflect the division's risk and capital structure.

12-36

# Chapter 12 Lecture – The Cost of Capital

## Four Mistakes to Avoid

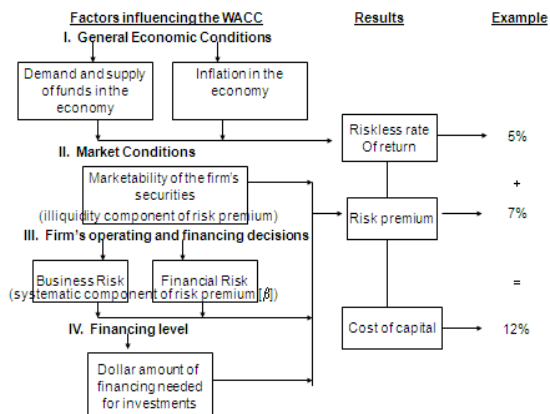

1. When estimating the cost of debt, don't use the coupon rate on existing debt. Use the current interest rate on new debt.
2. When estimating the risk premium for the CAPM approach, don't subtract the *current* long-term T-bond rate from the *historical* average return on common stocks.
  - For example, if the historical  $r_M$  has been about 12.2% and inflation drives the current  $r_{RF}$  up to 10%, the current market risk premium is not  $12.2\% - 10\% = 2.2\%$ !

12-37

## Four Mistakes to Avoid

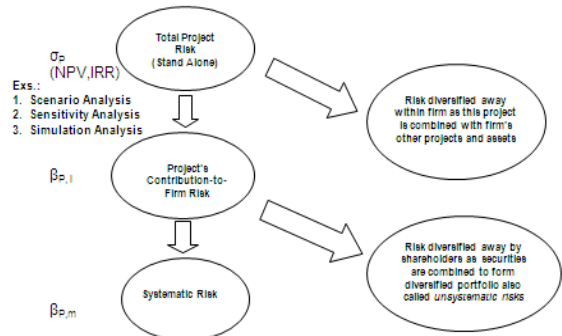

3. Don't use book weights to estimate the weights for the capital structure.
  - Use the target capital structure to determine the weights.
  - If you don't know the target weights, then use the current market value of equity, and never the book value of equity.
  - If you don't know the market value of debt, then the book value of debt often is a reasonable approximation, especially for short-term debt.
4. Always remember that capital components are sources of funding that come from investors.
  - Accounts payable, accruals, and deferred taxes are not sources of funding that come from investors, so they are not included in the calculation of the WACC.
  - We do adjust for these items when calculating the cash flows of the project, but not when calculating the WACC.

12-38

12-39

## Looking at 3 measures of a project's risk

12-40
